Red-cedar - prickly pear shale shrubland

This community type is restricted to steep, south-facing, eroding slopes composed of thinly bedded, fissile shales. The most representative examples occur along the Delaware River in Pike County. There may be species overlap with the "Red cedar - mixed hardwood rich shale woodland" community type that also occurs on south-facing shale slopes, but examples of this type occur on steeper slopes and lack endemic shale barren species. Typical species here include Juniperus uirginiana (red-cedar), Schizachyrium scoparium (little bluestem), Opuntia humifusa^s (prickly pear), Quercus ilicifolia (scrub oak), Q. montana (chestnut oak), Gaulussacia baccata (black huckleberry), Carya glabra (pignut hickory), Carex pensylvanica (Pennsylvania sedge), Hieracium venosum (rattlesnake-weed), Hypericum gentianoides (orange-grass), Danthonia spicata (poverty grass), Deschampsia flexuosa (common hairgrass), Vaccinium angustifolium (low sweet blueberry), V. pallidum (lowbush blueberry), Campanula rotundifolia (harebell), Arabis lyrata (lyre-leaved rock-cress), Aster patens (clasping aster), Corydalis semperuirens (rock harlequin), Solidago nemoralis (gray goldenrod), Polytrichum spp. (hairy-cap moss), Cladina spp., and Cladonia spp. (reindeer lichens).

Related types: The "Red cedar - mixed hardwood rich shale woodland" type also occurs on shale slopes, but is more southerly in distribution and, unlike this type, is characterized by the presence of shale barren endemics. **Range:** Ridge and Valley.
